

# JEE(Advanced) – 2018 TEST PAPER - 1 WITH SOLUTIONS

(Exam Date: 20-05-2018)

## PART-1 : MATHEMATICS

### SECTION-1

1. For a non-zero complex number  $z$ , let  $\arg(z)$  denotes the principal argument with  $-\pi < \arg(z) \leq \pi$ . Then, which of the following statement(s) is (are) **FALSE** ?

(A)  $\arg(-1 - i) = \frac{\pi}{4}$ , where  $i = \sqrt{-1}$

(B) The function  $f : \mathbb{R} \rightarrow (-\pi, \pi]$ , defined by  $f(t) = \arg(-1 + it)$  for all  $t \in \mathbb{R}$ , is continuous at all points of  $\mathbb{R}$ , where  $i = \sqrt{-1}$

(C) For any two non-zero complex numbers  $z_1$  and  $z_2$ ,  $\arg\left(\frac{z_1}{z_2}\right) - \arg(z_1) + \arg(z_2)$  is an integer multiple of  $2\pi$

(D) For any three given distinct complex numbers  $z_1, z_2$  and  $z_3$ , the locus of the point  $z$  satisfying the condition

$$\arg\left(\frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)}\right) = \pi, \text{ lies on a straight line}$$

**Ans. (A,B,D)**

**Sol.** (A)  $\arg(-1 - i) = -\frac{3\pi}{4}$ ,

$$(B) f(t) = \arg(-1 + it) = \begin{cases} \pi - \tan^{-1}(t), & t \geq 0 \\ -\pi + \tan^{-1}(t), & t < 0 \end{cases}$$

Discontinuous at  $t = 0$ .

$$(C) \arg\left(\frac{z_1}{z_2}\right) - \arg(z_1) + \arg(z_2)$$

$$= \arg z_1 - \arg(z_2) + 2n\pi - \arg(z_1) + \arg(z_2) = 2n\pi.$$

$$(D) \arg\left(\frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)}\right) = \pi$$

$$\Rightarrow \frac{(z-z_1)(z_2-z_3)}{(z-z_3)(z_2-z_1)} \text{ is real.}$$

$\Rightarrow z, z_1, z_2, z_3$  are concyclic.

2. In a triangle PQR, let  $\angle PQR = 30^\circ$  and the sides PQ and QR have lengths  $10\sqrt{3}$  and 10, respectively.

Then, which of the following statement(s) is (are) TRUE ?

(A)  $\angle QPR = 45^\circ$

(B) The area of the triangle PQR is  $25\sqrt{3}$  and  $\angle QRP = 120^\circ$

(C) The radius of the incircle of the triangle PQR is  $10\sqrt{3} - 15$

(D) The area of the circumcircle of the triangle PQR is  $100\pi$ .

Ans. (B,C,D)

Sol.  $\cos 30^\circ = \frac{(10\sqrt{3})^2 + (10)^2 - (PR)^2}{2 \times 10\sqrt{3} \times 10}$

$$\Rightarrow PR = 10$$

$$\because QR = PR \Rightarrow \angle PQR = \angle QPR$$

$$\angle QPR = 30^\circ$$

$$(B) \text{ area of } \Delta PQR = \frac{1}{2} \times 10\sqrt{3} \times 10 \times \sin 30^\circ = \frac{1}{2} \times 10 \times 10\sqrt{3} \times \frac{1}{2}$$

$$= 25\sqrt{3}$$

$$\angle QRP = 180^\circ - (30^\circ + 30^\circ) = 120^\circ$$

$$(C) r = \frac{\Delta}{S} = \frac{25\sqrt{3}}{\left(\frac{10+10+10\sqrt{3}}{2}\right)} = \frac{25\sqrt{3}}{10+5\sqrt{3}}$$

$$= 5\sqrt{3} \cdot (2 - \sqrt{3}) = 10\sqrt{3} - 15$$

$$(D) R = \frac{a}{2 \sin A} = \frac{10}{2 \sin 30^\circ} = 10$$

$$\therefore \text{Area} = \pi R^2 = 100\pi$$

3. Let  $P_1 : 2x + y - z = 3$  and  $P_2 : x + 2y + z = 2$  be two planes. Then, which of the following statement(s) is (are) TRUE ?

(A) The line of intersection of  $P_1$  and  $P_2$  has direction ratios 1, 2, -1

(B) The line  $\frac{3x-4}{9} = \frac{1-3y}{9} = \frac{z}{3}$  is perpendicular to the line of intersection of  $P_1$  and  $P_2$

(C) The acute angle between  $P_1$  and  $P_2$  is  $60^\circ$

(D) If  $P_3$  is the plane passing through the point (4, 2, -2) and perpendicular to the line of intersection of  $P_1$  and  $P_2$ , then the distance of the point (2, 1, 1) from the plane  $P_2$  is  $\frac{2}{\sqrt{3}}$

**Ans. (C,D)**

**Sol.** D.C. of line of intersection (a, b, c)

$$\Rightarrow 2a + b - c = 0$$

$$a + 2b + c = 0$$

$$\frac{a}{1+2} = \frac{b}{-1-2} = \frac{c}{4-1}$$

$\therefore$  D.C. is (1, -1, 1)

(B)  $\frac{3x-4}{9} = \frac{1-3y}{9} = \frac{z}{3}$

$$\Rightarrow \frac{x-4/3}{3} = \frac{y-1/3}{-3} = \frac{z}{3}$$

$\Rightarrow$  lines are parallel.

(C) Acute angle between  $P_1$  and  $P_2 = \cos^{-1}\left(\frac{2 \times 1 + 1 \times 2 - 1 \times 1}{\sqrt{6}\sqrt{6}}\right)$

$$= \cos^{-1}\left(\frac{3}{6}\right) = \cos^{-1}\left(\frac{1}{2}\right) = 60^\circ$$

(D) Plane is given by  $(x - 4) - (y - 2) + (z + 2) = 0$

$$\Rightarrow x - y + z = 0$$

$$\text{Distance of (2, 1, 1) from plane} = \frac{2-1+1}{\sqrt{3}} = \frac{2}{\sqrt{3}}$$

4. For every twice differentiable function  $f : \mathbb{R} \rightarrow [-2, 2]$  with  $(f(0))^2 + (f'(0))^2 = 85$ , which of the following statement(s) is (are) TRUE ?

(A) There exist  $r, s \in \mathbb{R}$ , where  $r < s$ , such that  $f$  is one-one on the open interval  $(r, s)$

(B) There exists  $x_0 \in (-4, 0)$  such that  $|f'(x_0)| \leq 1$

(C)  $\lim_{x \rightarrow \infty} f(x) = 1$

(D) There exists  $\alpha \in (-4, 4)$  such that  $f(\alpha) + f''(\alpha) = 0$  and  $f'(\alpha) \neq 0$

**Ans. (A,B,D)**

**Sol.**  $f(x)$  can't be constant throughout the domain. Hence we can find  $x \in (r, s)$  such that  $f(x)$  is one-one  
option (A) is true.

$$\text{Option (B): } |f'(x_0)| = \left| \frac{f(0) - f(-4)}{4} \right| \leq 1 \quad (\text{LMVT})$$

Option (C):  $f(x) = \sin(\sqrt{85x})$  satisfies given condition

$$\text{but } \lim_{x \rightarrow \infty} \sin(\sqrt{85x}) \text{ D.N.E.}$$

$\Rightarrow$  Incorrect

$$\text{Option (D): } g(x) = f^2(x) + (f'(x))^2$$

$$|f'(x_1)| \leq 1 \quad (\text{by LMVT})$$

$$|f(x_1)| \leq 2 \quad (\text{given})$$

$$\Rightarrow g(x_1) \leq 5 \quad \exists x_1 \in (-4, 0)$$

$$\text{Similarly } g(x_2) \leq 5 \quad \exists x_2 \in (0, 4)$$

$$g(0) = 85 \quad \Rightarrow g(x) \text{ has maxima in } (x_1, x_2) \text{ say at } \alpha.$$

$$g'(\alpha) = 0 \quad \& \quad g(\alpha) \geq 85$$

$$2f'(\alpha) (f(\alpha) + f''(\alpha)) = 0$$

$$\text{If } f'(\alpha) = 0 \Rightarrow g(\alpha) = f^2(\alpha) \geq 85 \text{ Not possible}$$

$$\Rightarrow f(\alpha) + f''(\alpha) = 0 \quad \exists \alpha \in (x_1, x_2) \in (-4, 4)$$

option (D) correct.

**5.** Let  $f : \mathbb{R} \rightarrow \mathbb{R}$  and  $g : \mathbb{R} \rightarrow \mathbb{R}$  be two non-constant differentiable functions. If  $f'(x) = (e^{(f(x)-g(x))})g'(x)$  for all  $x \in \mathbb{R}$ , and  $f(1) = g(2) = 1$ , then which of the following statement(s) is (are) TRUE ?

$$(A) f(2) < 1 - \log_e 2$$

$$(B) f(2) > 1 - \log_e 2$$

$$(C) g(1) > 1 - \log_e 2$$

$$(D) g(1) < 1 - \log_e 2$$

**Ans. (B,C)**

$$\text{Sol. } f'(x) = e^{(f(x)-g(x))} g'(x) \quad \forall x \in \mathbb{R}$$

$$\Rightarrow e^{-f(x)} \cdot f'(x) - e^{-g(x)} g'(x) = 0$$

$$\Rightarrow \int (e^{-f(x)} f'(x) - e^{-g(x)} g'(x)) dx = C$$

$$\Rightarrow -e^{-f(x)} + e^{-g(x)} = C$$

$$\Rightarrow -e^{-f(1)} + e^{-g(1)} = -e^{-f(2)} + e^{-g(2)}$$

$$\Rightarrow -\frac{1}{e} + e^{-g(1)} = -e^{-f(2)} + \frac{1}{e}$$

$$\Rightarrow e^{-f(2)} + e^{-g(1)} = \frac{2}{e}$$

$$\therefore e^{-f(2)} < \frac{2}{e} \text{ and } e^{-g(1)} < \frac{2}{e}$$

$$\Rightarrow -f(2) < \ln 2 - 1 \text{ and } -g(1) < \ln 2 - 1$$

$$\Rightarrow f(2) > 1 - \ln 2 \text{ and } g(1) > 1 - \ln 2$$

6. Let  $f : [0, \infty) \rightarrow \mathbb{R}$  be a continuous function such that  $f(x) = 1 - 2x + \int_0^x e^{x-t} f(t) dt$

for all  $x \in [0, \infty)$ . Then, which of the following statement(s) is (are) TRUE ?

(A) The curve  $y = f(x)$  passes through the point (1, 2)

(B) The curve  $y = f(x)$  passes through the point (2, -1)

(C) The area of the region  $\{(x, y) \in [0, 1] \times \mathbb{R} : f(x) \leq y \leq \sqrt{1-x^2}\}$  is  $\frac{\pi-2}{4}$

(D) The area of the region  $\{(x, y) \in [0, 1] \times \mathbb{R} : f(x) \leq y \leq \sqrt{1-x^2}\}$  is  $\frac{\pi-1}{4}$

**Ans. (B,C)**

**Sol.**  $f(x) = 1 - 2x + \int_0^x e^{x-t} f(t) dt$

$$\Rightarrow e^{-x} f(x) = e^{-x} (1 - 2x) + \int_0^x e^{-t} f(t) dt$$

Differentiate w.r.t. x.

$$-e^{-x} f(x) + e^{-x} f'(x) = -e^{-x} (1 - 2x) + e^{-x} (-2) + e^{-x} f(x)$$

$$\Rightarrow -f(x) + f'(x) = -(1 - 2x) - 2 + f(x).$$

$$\Rightarrow f'(x) - 2f(x) = 2x - 3$$

Integrating factor =  $e^{-2x}$ .

$$f(x) \cdot e^{-2x} = \int e^{-2x} (2x - 3) dx$$

$$= (2x - 3) \int e^{-2x} dx - \int \left( (2) \int e^{-2x} dx \right) dx$$

$$= \frac{(2x - 3)e^{-2x}}{-2} - \frac{e^{-2x}}{2} + c$$

$$f(x) = \frac{2x - 3}{-2} - \frac{1}{2} + ce^{2x}$$

$$f(0) = \frac{3}{2} - \frac{1}{2} + c = 1 \Rightarrow c = 0$$

$$\therefore f(x) = 1 - x$$

$$\text{Area} = \frac{\pi}{4} - \frac{1}{2} = \frac{\pi - 2}{4}$$

## SECTION-2

7. The value of  $\left((\log_2 9)^2\right)^{\frac{1}{\log_2(\log_2 9)}} \times (\sqrt{7})^{\frac{1}{\log_4 7}}$  is —

**Ans. (8)**

$$\begin{aligned} \text{Sol. } & \log_2 9^{\frac{2}{\log_2(\log_2 9)}} \times 7^{\frac{1/2}{\log_4 7}} \\ & = (\log_2 9)^{2 \log_2^2 \log_2 9} \times 7^{\frac{1}{2} \log_7 4} \\ & = 4 \times 2 = 8 \end{aligned}$$

8. The number of 5 digit numbers which are divisible by 4, with digits from the set  $\{1, 2, 3, 4, 5\}$  and the repetition of digits is allowed, is —

**Ans. (625)**

**Sol.** Option for last two digits are (12), (24), (32), (44) are (52).

$$\begin{aligned} \therefore \text{Total No. of digits} \\ & = 5 \times 5 \times 5 \times 5 = 625 \end{aligned}$$

9. Let X be the set consisting of the first 2018 terms of the arithmetic progression 1, 6, 11, ....., and Y be the set consisting of the first 2018 terms of the arithmetic progression 9, 16, 23, ....., Then, the number of elements in the set  $X \cup Y$  is —

**Ans. (3748)**

**Sol.** X : 1, 6, 11, ....., 10086

Y : 9, 16, 23, ....., 14128

$X \cap Y$  : 16, 51, 86, .....

Let  $m = n(X \cap Y)$

$$\therefore 16 + (m - 1) \times 35 \leq 10086$$

$$\Rightarrow m \leq 288.71$$

$$\Rightarrow m = 288$$

$$\begin{aligned} \therefore n(X \cup Y) &= n(X) + n(Y) - n(X \cap Y) \\ &= 2018 + 2018 - 288 = 3748 \end{aligned}$$

10. The number of real solutions of the equation

$$\sin^{-1}\left(\sum_{i=1}^{\infty} x^{i+1} - x \sum_{i=1}^{\infty} \left(\frac{x}{2}\right)^i\right) = \frac{\pi}{2} - \cos^{-1}\left(\sum_{i=1}^{\infty} \left(-\frac{x}{2}\right)^i - \sum_{i=1}^{\infty} (-x)^i\right)$$

lying in the interval  $\left(-\frac{1}{2}, \frac{1}{2}\right)$  is —

(Here, the inverse trigonometric functions  $\sin^{-1}x$  and  $\cos^{-1}x$  assume value in  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  and  $[0, \pi]$ , respectively.)

Ans. (2)

Sol. 
$$\sum_{i=1}^{\infty} x^{i+1} = \frac{x^2}{1-x}$$

$$\sum_{i=1}^{\infty} \left(\frac{x}{2}\right)^i = \frac{x}{2-x}$$

$$\sum_{i=1}^{\infty} \left(-\frac{x}{2}\right)^i = \frac{-x}{2+x}$$

$$\sum_{i=1}^{\infty} (-x)^i = \frac{-x}{1+x}$$

To have real solutions

$$\sum_{i=1}^{\infty} x^{i+1} - x \sum_{i=1}^{\infty} \left(\frac{x}{2}\right)^i = \sum_{i=1}^{\infty} \left(-\frac{x}{2}\right)^i - \sum_{i=1}^{\infty} (-x)^i$$

$$\frac{x^2}{1-x} - \frac{x^2}{2-x} = \frac{-x}{2+x} + \frac{x}{1+x}$$

$$x(x^3 + 2x^2 + 5x - 2) = 0$$

$$\therefore x = 0 \text{ and let } f(x) = x^3 + 2x^2 + 5x - 2$$

$$f\left(\frac{1}{2}\right) \cdot f\left(-\frac{1}{2}\right) < 0$$

Hence two solutions exist

11. For each positive integer n, let

$$y_n = \frac{1}{n}(n+1)(n+2)\dots(n+n)^{1/n}$$

For  $x \in \mathbb{R}$ , let  $[x]$  be the greatest integer less than or equal to  $x$ . If  $\lim_{n \rightarrow \infty} y_n = L$ , then the value of  $[L]$

is —

**Ans. (1)**

**Sol.**  $y_n = \left\{ \left(1 + \frac{1}{n}\right) \left(1 + \frac{2}{n}\right) \dots \left(1 + \frac{n}{n}\right) \right\}^{\frac{1}{n}}$

$$y_n = \prod_{r=1}^n \left(1 + \frac{r}{n}\right)^{1/n}$$

$$\log y_n = \frac{1}{n} \sum_{r=1}^n \ell n \left(1 + \frac{r}{n}\right)$$

$$\Rightarrow \lim_{n \rightarrow \infty} \log y_n = \lim_{x \rightarrow \infty} \sum_{r=1}^n \frac{1}{n} \ell n \left(1 + \frac{r}{n}\right)$$

$$\Rightarrow \log L = \int_0^1 \ell n(1+x) dx$$

$$\Rightarrow \log L = \log \frac{4}{e}$$

$$\Rightarrow L = \frac{4}{e}$$

$$\Rightarrow [L] = 1$$

**12.** Let  $\vec{a}$  and  $\vec{b}$  be two unit vectors such that  $\vec{a} \cdot \vec{b} = 0$ . For some  $x, y \in \mathbb{R}$ , let  $\vec{c} = x\vec{a} + y\vec{b} + (\vec{a} \times \vec{b})$ . If  $|\vec{c}| = 2$  and the vector  $\vec{c}$  is inclined at the same angle  $\alpha$  to both  $\vec{a}$  and  $\vec{b}$ , then the value of  $8\cos^2 \alpha$  is —

**Ans. (3)**

**Sol.**  $\vec{c} = x\vec{a} + y\vec{b} + \vec{a} \times \vec{b}$

$$\vec{c} \cdot \vec{a} = x \text{ and } x = 2\cos\alpha$$

$$\vec{c} \cdot \vec{b} = y \text{ and } y = 2\cos\alpha$$

$$\text{Also, } |\vec{a} \times \vec{b}| = 1$$

$$\therefore \vec{c} = 2\cos(\vec{a} + \vec{b}) + \vec{a} \times \vec{b}$$

$$\vec{c}^2 = 4\cos^2 \alpha (\vec{a} + \vec{b})^2 + (\vec{a} \times \vec{b})^2 + 2\cos\alpha (\vec{a} + \vec{b}) \cdot (\vec{a} \times \vec{b})$$

$$4 = 8\cos^2 \alpha + 1$$

$$8\cos^2 \alpha = 3$$

**13.** Let  $a, b, c$  be three non-zero real numbers such that the equation

$$\sqrt{3}a \cos x + 2b \sin x = c, \quad x \in \left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$$

has two distinct real roots  $\alpha$  and  $\beta$  with  $\alpha + \beta = \frac{\pi}{3}$ . Then the value of  $\frac{b}{a}$  is —

**Ans. (0.5)**

**Sol.**  $\sqrt{3} \cos x + \frac{2b}{a} \sin x = \frac{c}{a}$

Now,  $\sqrt{3} \cos \alpha + \frac{2b}{a} \sin \alpha = \frac{c}{a}$  ..... (1)

$$\sqrt{3} \cos \beta + \frac{2b}{a} \sin \beta = \frac{c}{a} \quad \dots (2)$$

$$\sqrt{3} [\cos \alpha - \cos \beta] + \frac{2b}{a} (\sin \alpha - \sin \beta) = 0$$

$$\sqrt{3} \left[ -2 \sin \left( \frac{\alpha + \beta}{2} \right) \sin \left( \frac{\alpha - \beta}{2} \right) \right] + \frac{2b}{a} \left[ 2 \cos \left( \frac{\alpha + \beta}{2} \right) \sin \left( \frac{\alpha - \beta}{2} \right) \right] = 0$$

$$-\sqrt{3} + 2\sqrt{3} \cdot \frac{b}{a} = 0$$

$$\frac{b}{a} = \frac{1}{2} = 0.5$$

- 14.** A farmer  $F_1$  has a land in the shape of a triangle with vertices at  $P(0, 0)$ ,  $Q(1, 1)$  and  $R(2, 0)$ . From this land, a neighbouring farmer  $F_2$  takes away the region which lies between the side  $PQ$  and a curve of the form  $y = x^n$  ( $n > 1$ ). If the area of the region taken away by the farmer  $F_2$  is exactly 30% of the area of  $\Delta PQR$ , then the value of  $n$  is —

**Ans. (4)**

$$\text{Area} = \int_0^1 (x - x^n) dx = \frac{3}{10}$$

$$\left[ \frac{x^2}{2} - \frac{x^{n+1}}{n+1} \right]_0^1 = \frac{3}{10}$$

$$\frac{1}{2} - \frac{1}{n+1} = \frac{3}{10} \quad \therefore n + 1 = 5$$

$$\Rightarrow n = 4$$

**PARAGRAPH "X"**

Let S be the circle in the xy-plane defined by the equation  $x^2 + y^2 = 4$

(There are two questions based on Paragraph "X", the question given below is one of them)

16. Let P be a point on the circle S with both coordinates being positive. Let the tangent to S at P intersect the coordinate axes at the points M and N. Then, the mid-point of the line segment MN must lie on the curve -

(A)  $(x + y)^2 = 3xy$

(B)  $x^{2/3} + y^{2/3} = 2^{4/3}$

(C)  $x^2 + y^2 = 2xy$

(D)  $x^2 + y^2 = x^2y^2$

**Ans. (D)**

Tangent at  $P(2\cos\theta, 2\sin\theta)$  is  $x\cos\theta + y\sin\theta = 2$

$M(2\sec\theta, 0)$  and  $N(0, 2\csc\theta)$

Let midpoint be  $(h, k)$

$h = \sec\theta, k = \csc\theta$

$$\frac{1}{h^2} + \frac{1}{k^2} = 1$$

$$\frac{1}{x^2} + \frac{1}{y^2} = 1$$

**PARAGRAPH "A"**

There are five students  $S_1, S_2, S_3$  and  $S_4$  and  $S_5$  in a music class and for them there are five sets  $R_1, R_2, R_3, R_4$  and  $R_5$  arranged in a row, where initially the seat  $R_i$  is allotted to the student  $S_i, i = 1, 2, 3, 4, 5$ . But, on the examination day, the five students are randomly allotted the five seats.

(There are two questions based on Paragraph "A". the question given below is one of them)

17. The probability that, on the examination day, the student  $S_1$  gets the previously allotted seat  $R_1$  and **NONE** of the remaining students gets the seat previously allotted to him/her is -

(A)  $\frac{3}{40}$

(B)  $\frac{1}{8}$

(C)  $\frac{7}{40}$

(D)  $\frac{1}{5}$

**Ans. (A)**

**Sol.** Required probability =  $\frac{4! \left( \frac{1}{2!} - \frac{1}{3!} + \frac{1}{4!} \right)}{5!} = \frac{9}{120} = \frac{3}{40}$

**PARAGRAPH "A"**

There are five students  $S_1, S_2, S_3, S_4$  and  $S_5$  in a music class and for them there are five seats  $R_1, R_2, R_3, R_4$  and  $R_5$  arranged in a row, where initially the seat  $R_i$  is allotted to the student  $S_i, i = 1, 2, 3, 4, 5$ . But, on the examination day, the five students are randomly allotted the five seats.

*(There are two questions based on Paragraph "A", the question given below is one of them)*

- 18.** For  $i = 1, 2, 3, 4$ , let  $T_i$  denote the event that the students  $S_i$  and  $S_{i+1}$  do **NOT** sit adjacent to each other on the day of the examination. Then the probability of the event  $T_1 \cap T_2 \cap T_3 \cap T_4$  is-

- (A)  $\frac{1}{15}$                       (B)  $\frac{1}{10}$                       (C)  $\frac{7}{60}$                       (D)  $\frac{1}{5}$

**Ans. (C)**

**Sol.**  $n(T_1 \cap T_2 \cap T_3 \cap T_4) = \text{Total} - n(\bar{T}_1 \cup \bar{T}_2 \cup \bar{T}_3 \cup \bar{T}_4)$

$$= 5! - \left( {}^4C_1 4! 2! - \left( {}^3C_1 \cdot 3! 2! + {}^3C_1 3! 2! 2! \right) + \left( {}^2C_1 2! 2! + {}^4C_1 \cdot 2 \cdot 2! \right) - 2 \right)$$

$$= 14$$

$$\text{Probability} = \frac{14}{5!} = \frac{7}{60}$$
